ABSTRACT

Indians have sentimental values towards owning a house. The Residential Sector in Panvel Region has significant social stress in terms of rising urbanization, expanding middle class and shortage of affordable Residential properties. Buyers have started considering Residential property as a product of pride and social security, compared to traditional mode of consumption as ownership and investment. Choosing the right residential property is crucial enough for the buyer.

Developers in Residential Sector are exploring the different dimensions of consumption patterns in order to attract customers. The level of consumer's satisfaction provides the scope for positive word of mouth and loyal customer community as future prospective buyers. This study attempts to explore demographic factors that affect buying behavior in residential sector. The study further attempts to evaluate key success factors that play active role in overall decision making.

The interpretations are drawn based on the primary research, mainly by getting questionnaires filled from prospective homebuyers in Panvel residing in Navi Mumbai. Secondary research is based on survey reports, research journals and various other sources. A sample of 61 respondents is considered to statistically interpret the results.

KEYWORDS: Demographic Factors, Buying behavior, Residential Sector

1. INTRODUCTION

In today’s competitive scenario, developers in residential sector are most worried about the uncertainty. Growing complexity of regulations, value seeking consumers, shrinking availability of funds, vulnerable demand forecast, ever increasing unutilized inventory, are few of the environmental factors difficult to cope up. Considering, there is no other alternative but to face this situation, developers in residential sector have started exploring the holistic approach to attract customer base.

2. OBJECTIVES OF THE STUDY

- To study the Demographic Factors that affects the buying behavior in residential sector.
- To understand the impact of Demographic Factors in isolation and jointly; with the help of frequency analysis and cross tabulation respectively.

3. STATEMENT OF THE PROBLEM

As pointed out by India Brand Equity Foundation, residential sector in India has significant role and contribution to the GDP and economic growth. Thus, it is imperative for residential project developers to assess the factors that influence purchasing of Residential properties. In wake of rising competition, it is advisable for residential project developers to introduce novel approach to attract prospective buyers.

There are very few studies available in India when it comes to studying buying behavior in residential sector. Main objective of this research paper is to assess the demographic factors that influence buying behavior in residential sector.

4. LITERATURE REVIEW

4.1 Residential Property Buying

Residential property is the only product that is utilized for consumption and investment purpose. It is utmost important to understand residential purchases through behavioral lenses apart from laws of economics.

The safety and soundness of the housing market in India is majorly influenced by distinctive characteristics of the demographic/social features and housing loan facility structure; in terms of available loan rate, loan process, loan margin and collateral structure. The borrower’s default on housing loan payments, mainly due to a change in the market value of the property versus loan amount and EMI to income ratio. A 10 percent decrease in the market value of the property vis-a` - vis the loan amount raises the odds of default by 1.55 percent. Similarly, a 10 percent increase in
EMI to income ratio raises the delinquency chance by 4.50 percent. However, borrower characteristics like marital status, employment situation, regional locations, city locations, age profile and house preference, also act as default triggers, and thus cannot be ignored.

Broad behavioral theories point out that real estate market is neither rational nor irrational and based on investor’s’ knowledge. Behavioral biases could be responsible for mispricing in real estate sector, as investors and policymakers, are not able to accommodate and arrive at fair market price. The inclusion of behavioral biases into the construction of price index will greatly improve the traditional price index. The collaborative approach of investors and policymakers can curtail mispricing in real estate sector.\(^2\)

Owning a housing accommodation offers more financial satisfaction.\(^3\) Financial satisfaction levels of Individual investors in India (urban socio-economic classification segment-A) is affected by demographic and socio-economic factors such as age, marital status, occupation, work experience, income, saving rate, nature of household accommodation and investment tenure.

Perceptions towards housing alternatives vary between Sexes and marital status, in terms of provision of stairs, the garden, loneliness and problems or difficulties associated with bereavement; the number of builders contacted and schemes known.\(^4\)

### 4.2 Real Estate Sector: Current Scenario in India

The Residential sector in India contributes 5-6 percent to the country’s Gross GDP and overall real estate market is projected to touch US$ 180 billion by 2020 with 11.2 percent CAGR.

The subsectors of the real estate sector are - Residential, retail, hospitality, and commercial. The conducive corporate environment, demand for office space, urban and semi-urban accommodations is anticipated to provide boost for much-needed infrastructure growth in Indian real estate sector.

Government initiatives like sanctioning of a home loan up to 90%, the rise in the limit on home loan interest from Rs 1.5 lakh to Rs 2 lakh, boosting household savings by exempting limit from Rs 2 lakh to Rs 2.5 lakh; have further boosted customers’ confidence in real estate property purchases.

Near absence of transparency proves to be a ‘black box’ to foreign direct investors in emerging markets. The larger or older Indian firms in smaller cities which are not seeking foreign investment significantly differ in the development process from the US- benchmark model.\(^5\)

The Indian RES was not regulated prior to the passage of the Indian Real Estate Act, 2016. The Indian Real Estate Act 2016 has proved to be an economic reform for the real estate sector and supposed to protect consumers’ interest by tightening fraudulent practices of promoters/developers.\(^6\)
As per India Brand Equity Foundation, the Indian real estate sector is expected to reach a market size of US$ 1 trillion by 2030.

**Boosters in residential sector**

The Indian real estate market - US$ 180 billion by 2020 (projected size of market)

Housing sector -11 per cent to India’s GDP by 2020. (expected)

FY2008-2020- proposed CAGR of 11.2 per cent.

booming sectors having impact on residential sector: Retail, hospitality and commercial real estate

2017- M&A deals worth US$ 3.26 billion (real estate sector)

Private equity investments: 15 per cent increase in 2017 to reach US$ 800 million.

The Smart City Project: to build 100 smart cities, is a prime opportunity

2018 : creation of National Urban Housing Fund of Rs 60,000 crore (US$ 9.27 billion).

Pradhan Mantri Awas Yojana (PMAY): 1,427,486 houses have been sanctioned in 2017-18.

2018, plan to build 13,21,567 affordable houses

5. RESEARCH METHODOLOGY

a) Coverage of the Study: This research paper assesses impact of Demographic Factors on buying behaviors with specific reference of residential sector only.

b) Source of Data: This research paper is descriptive in nature. Secondary data resources are old research papers, various e-journals, books, websites, whitepapers, newspapers etc. Primary data was collected by survey through questionnaires and interviews. Questionnaire consisted of both open ended and close ended questions to get a mix of both qualitative and quantitative data.

Keeping objectives of the research in mind, the researcher approached 61 customers (prospective home buyers in Panvel Region) by using convenience sampling technique from Navi Mumbai.

To assess impact of demographic factors on purchase intentions in residential sector, researcher defined the scope of study as

1. Demographic factors
   - Gender- Male, Female
   - Age- in the bracket of < 25 years, 25-30 years, 30-35 years, 35-40 years, 40-45 years, >45 years
   - Annual family Income- < 3 lac, 3-5 lac, 5-7.5 lac, 7.5-10 lac, > 10 lac
   - Marital status- Married, Unmarried, Committed
   - Education- Undergraduate, Graduate, Post-Graduate, Other
   - Size of the Family - < 4 members, 4-6 members, 6-10 members, > 10 members
   - Family set-up- Nuclear family, Joint family, Staying alone
   - Occupation-Self-employed, govt. employee, Private Sector employee, Agriculture

2. Purchase intentions
   - Time required to buy a new residential property- Immediately, 3 months- 6 months, 6 months- 9 months, 9 months- 1 year, More than 1 year
   - Residential project identification- Yes, No
   - type of purchase- First time buyer, Repeat purchase
   - purpose of buying - Self-occupancy, Investment purpose only
   - size of apartment- 1RK, 1 BHK, 2 BHK, > 2 BHK, Other
   - property type- Standalone building with basic infrastructure, Property with moderate infrastructure and amenities, Luxury projects
decisions makers- Self, Parents, Spouse, Children, Entire family

(c) Data Analysis: Analysis of data and information collected from published sources were made keeping the objectives of the study in mind. The data was further processed and analyzed with the help of SPSS- Version 21.

6. RESULTS AND FINDINGS

A. Frequency Analysis (Annexure-1)
   - Gender configuration: 59% Males and 41% Females
   - Age- <31% from the bracket of 35-40 years followed by 30-35 years contributing 20%
   - Marital status- sample consisted 60% of the Married people
   - Education- Undergraduate, Graduate, Post-Graduate, Other
   - Occupation- private sector employees (55%) forms major chunk of prospective homebuyers
   - Income- more than 10 lacs annual income- 31%; 7.5-10 lacs- 30%
   - Family set-up- majority from nuclear family

B. Hypotheses Testing: Significance Level- 95% (Annexure 2)
   - Accepting the null hypotheses for equal probabilities for factors- gender, age, marital status, family size and project identification
   - Rejecting the null hypotheses for equal probabilities for factors-income, education, family set-up, duration of stay in Panvel, intention to buy, purchase duration

C. Cross Tabulation: Annexure 3
   i. Assessing impact of size of the family on the preference of apartment size with a layer of family’s annual income
      - Chi-square ratio (p value>0.05) shows there is no significant association between preferences of Apartment size across income groups.
      - The cross tabulation also reflects majority preference to 1BHK across income groups followed by 2 BHK.
   ii. Association between the factors- purpose of purchase, buying intention and duration of residence in Panvel.
      - Chi-square ratio (p value>0.05) shows buying decisions are independent of the factors like purpose of purchase of a residential property and an individual’s duration of stay in Panvel Area.
      - The cross tabulation also reflects equal percentage of people buying property for self-occupation and investment as well. 50% of the population have zeroed Panvel region as hot destination as residential market.
7. CONCLUSION

Indian housing market is witnessing staggering efforts of developers and regulators to lure investors, as millions of housing inventories are piling up. With a growing economy and changing buyer expectations, real estate developers are constantly being innovative with their business plans. Every buyer has unique and specific requirement from ‘housing’ as a product, and the developers have had to adapt accordingly. Borrowers’ demographic characteristics like marital status, employment situation, regional locations, city locations, age profile and house preference, act as default triggers, and thus cannot be ignored.

8. LIMITATIONS OF THE STUDY

• This study acknowledges that it is restricted to prospective home buyers of Panvel Region, who are planning to buy a residential property in Panvel Region.
• Independent bungalows, row-houses and self-constructed houses have not been considered.
• The recent trends in housing sector were beyond the scope of this study- like green housing, senior citizens community housing, and housing with special features like solar panels etc

9. ACKNOWLEDGEMENT

The author would like to thank her thesis guide and supervisor: Dr. Artee Aggrawal, for her immense support and encouragement. The author would also like to thank Dr. A.A. Attarwala, for reviewing the research article and providing his valuable feedback. The author is grateful to her fellow doctoral students and library resource specialists of Amity Business School, Mumbai, India, for their support and cooperation. This paper is a small part of doctoral work carried out by the author to Amity Business School, Mumbai, India
