#### Abstract

: Suppose $G$ be a (m, n) graph. Suppose f be a map from $\mathrm{h}(\mathrm{G})$ to $\{1,2, \ldots, \mathrm{~m}\}$. For each edge xy assign, the label $|h(x)-h(y)|$. $h$ is difference cordial if $f$ is $1-1$ and $\left|e_{h}(0)-e_{h}(1)\right| \leq 1$, where $e_{h}(1)$ and $e_{h}(0)$ denote the number of edges with labeled 1 except labeled with 1 respectively. A graph which admit difference cordial labeling is called a difference cordial graph.

In this paper we prove the following results. 1. Vertex switching of cycle is difference cordial. 2. Vertex switching of cycle with one chord is difference cordial. 3. Vertex switching of cycle with twin chords is difference cordial. 4. Vertex switching of path graph is difference cordial. 5. Ring sum of star graph and cycle graph is difference cordial. 6. Ring sum of star graph and cycle with one chord is difference cordial. 7. Ring sum of star graph and gear graph is difference cordial. 8. Ring sum of star graph and path graph is difference cordial.

KEYWORD: Difference cordial labelling, Vertex switching and Ring sum.
MSC AMS Classification:05C78

[^0]
## INTRODUCTION:

The graph consider in this paper are finite, undirected and simple graphs only. The percept of Difference cordial labeling was brought out by R. Kala, S. SathishNarayanan andR. Ponraj ${ }^{4}$.Notation and definitions not described here are used in the sense of Gross and Yellen ${ }^{3}$.Gallian ${ }^{2}$ published and updateda dynamic survey of graph labeling every year.Rokad and Ghodasara ${ }^{5}$ proved that vertex switching of petersen graph, switching of wheel graph, switching of flower graph, switching of gear graph and switching of shell graph are cordial. Rokad and Ghodasara ${ }^{6}$ proved that Ring sum of star graph and gear graph, Ring sum of star graph and cycle graph,Ring sum of star graph and cycle with one chord are 3-equitable graphs.
Definition 1 The vertex switching Gv of a graph G is get by taking a vertex vof G, removing all the edges incident to v and adding edges joining v to every other vertex which is not adjacent to v in G .

Definition 2 Ring sum $G_{1} \oplus G_{2}$ of two graphs $G_{1}=\left(V_{1}, E_{1}\right)$ and $G_{2}=\left(V_{2}, E_{2}\right)$ is the graph $\mathrm{G}_{1} \oplus \mathrm{G}_{2}=\left(\mathrm{V}_{1} \cup \mathrm{~V}_{2},\left(\mathrm{E}_{1} \cup \mathrm{E}_{2}\right)-\left(\mathrm{E}_{1} \cap \mathrm{E}_{2}\right)\right)$.
Theorem 1:Switching of vertex of $\mathrm{C}_{\mathrm{n}}$ is difference cordial.
Proof:Suppose $G=C_{n}$ and $z_{1}, z_{2}, \ldots, z_{n}$ be successive vertices of $C_{n}$. Suppose $\left(C_{n}\right)_{z 1}$ represent the switched vertex of $C_{n}$ with respect to $Z_{1}$ of $C_{n}$. Consider $Z_{1}$ as the switched vertex and we start labeling pattern from $\mathrm{z}_{1}$. Then $|\mathrm{E}(\mathrm{G})|=2 \mathrm{n}-5$ and $|\mathrm{V}(\mathrm{G})|=\mathrm{n}$.
We define the labeling function $\mathrm{h}: \mathrm{V}\left(\left(\mathrm{C}_{\mathrm{n}}\right) \mathrm{z}_{1}\right) \rightarrow\{1,2, \ldots, \mathrm{n}\}$, as follows
$h\left(z_{i}\right)=i, i \in[1, n]$.
Since $e_{h}(1)=n-2$ and $e_{h}(0)=n-3$.
Hence, Switching of vertex of cycle $\mathrm{C}_{\mathrm{n}}$ is difference cordial.
Example 1:Switching of vertex of cycle $\mathrm{C}_{7}$ admitting difference cordial labeling is shown in Figure 1.

Figure 1

Theorem 2:Switching of vertex ofcycle $C_{n}(n \geq 4, n \in N)$ having one chord admitsdivisor cordial labeling, where chord makea triangle with two edges of cycle $C_{n}$.
Proof: Suppose G be the cycle having one chord. Supposez $z_{1}, \mathrm{z}_{2}, \ldots, \mathrm{z}_{\mathrm{n}}$ be the successive vertices of cycle $C_{n}$ and $e=z_{n} z_{2}$ be the chord of cycle $C_{n}$. The edges $e=z_{n} z_{2}, e_{1}=z_{2} z_{1}, e_{2}=z_{n} z_{1}$ form a triangle.

Now the graph get by switching of vertices $z_{i}$ and $z_{j}$ of degree 2 areisomorphic to each other for all $i$ and $j$. Similarly the graph get by switching of vertices $z_{i}$ and $z_{j}$ of degree 3 are isomorphic to each other for all i and j.Hence we need to talk about two cases: (i) switching of an arbitrary vertex ofG of degree 3, (ii) switching of an arbitrary vertex of $G$ of degree 2 . Without detriment of generality suppose the switched vertex be $\mathrm{z}_{1}$ (of either degree 3 or degree 2 ) and suppose $\mathrm{G}_{\mathrm{z} 1}$ denote the switching of vertex of $G$ with respect to vertex $z_{1}$.
To define labeling function $\mathrm{h}: \mathrm{V}\left(\mathrm{G}_{\mathrm{z} 1}\right) \rightarrow\{1,2, \ldots, \mathrm{n}\}$ we consider the following cases.
Case I: Degree of $\mathrm{z}_{1}$ is 2 .
(Here the number of vertices is $n$ and number of edges is $2 \mathrm{n}-4$.)
$h\left(z_{i}\right)=i, i \in[1, n]$.
Since $\mathrm{e}_{\mathrm{h}}(1)=\mathrm{e}_{\mathrm{h}}(0)=\mathrm{n}-2$.
Case II: Degree of $x_{1}$ is 3 .
(Here the number of vertices is $n$ and number of edges is $2 \mathrm{n}-6$.)
$\mathrm{h}\left(\mathrm{z}_{\mathrm{n}}\right)=\mathrm{n}-1$,
$\mathrm{h}\left(\mathrm{Z}_{\mathrm{n}-1}\right)=\mathrm{n}$
$h\left(z_{i}\right)=i, i \in[1, n-2]$.
Since $e_{h}(1)=e_{h}(0)=n-3$.
Hence, Switching of vertex of cycle $\mathrm{C}_{\mathrm{n}}$ having one chord admitsdivisor cordial labeling.

## Example 2:

(a) Figure 2(a) shows switching of vertex of degree 2 of cycle $\mathrm{C}_{8}$ having one chord admitting difference cordial labeling.
(b) Figure 2(b) shows switching of vertex of degree 3 of cycle $\mathrm{C}_{8}$ having one chord admittingdifference cordial labeling.

Theorem 3: Switching of vertex of cyclehaving twin chords $C_{n, 3}$ admits difference cordial labeling.

Proof: Suppose G be the cycle having twin chords $C_{n, 3}$. Supposex $x_{1}, x_{2}, \ldots, x_{n}$ be the successive
vertices of G. Suppose $e_{1}=x_{n} x_{2}$ and $e_{2}=x_{n} x_{3}$ be the chords of cycle $C_{n}$ which form two triangles and one cycle Cn-2.

Now the graph get by switching of vertices $x_{i}$ and $x_{j}$ of degree 2 areisomorphic to each other for all $i$ and $j$. Similarly the graph get by switching of vertices $x_{i}$ and $x_{j}$ of degree 3 are isomorphic to each other and the graphget by switching of vertices $x_{i}$ and $x_{j}$ of degree 4 are isomorphic to eachother for all i and j . Hence we need to talk about three cases: (i) switching ofan arbitrary vertex of G of degree 2, (ii) switching of an arbitrary vertex of Gof degree 3, (iii) switching of an arbitrary vertex of $G$ of degree 4 . With out detriment of generality suppose the switched vertex be $x_{1}$ and suppose $G_{x 1}$ denote the switching of vertex of $G$ with respect to vertex $x_{1}$.
To define labeling function $\mathrm{h}: \mathrm{V}\left(\mathrm{G}_{\mathrm{x} 1}\right)\{1,2, \ldots, \mathrm{n}\}$ we consider the following cases.
Case 1: Degree of $x_{1}$ is2
(Here the number of vertices is $n$ and number of edges is $2 \mathrm{n}-3$.)
$h\left(\mathrm{x}_{\mathrm{i}}\right)=\mathrm{i}, \mathrm{i} \in[1, \mathrm{n}]$.
Since $\mathrm{e}_{\mathrm{h}}(1)=\mathrm{n}-2$ and $\mathrm{e}_{\mathrm{h}}(0)=\mathrm{n}-1$.
Case 2: Degree of $x_{1}$ is 3
(Here the number of vertices is $n$ and number of edges is $2 n-5$.)
$\mathrm{h}\left(\mathrm{x}_{\mathrm{n}}\right)=\mathrm{n}-1$,
$h\left(\mathrm{x}_{\mathrm{n}-1}\right)=\mathrm{n}$
$\mathrm{h}\left(\mathrm{x}_{\mathrm{i}}\right)=\mathrm{i}, \mathrm{i} \in[1, \mathrm{n}-2]$.
Since $\mathrm{e}_{\mathrm{h}}(1)=\mathrm{n}-3$ and $\mathrm{e}_{\mathrm{h}}(0)=\mathrm{n}-2$.

Case 3: Degree of $x_{1}$ is 4
(Here the number of vertices is $n$ and number of edges is $2 n-7$.)
The labeling pattern is same as case -2 .
Since $\mathrm{e}_{\mathrm{h}}(1)=\mathrm{n}-3$ and $\mathrm{e}_{\mathrm{h}}(0)=\mathrm{n}-4$.
Thus, $\left|e_{h}(1)-e_{h}(0)\right| \leq 1$.
Hence Switching of vertex of cyclehaving twin chords $\mathrm{C}_{\mathrm{n}, 3}$ admits difference cordial labeling.

## Example3:

(a) Figure 3(a) shows switching of vertex of degree 2 of cycle C9having twin chords admitting difference cordial labeling.
(b)Figure 3(b) shows switching of vertex of degree 3 of cycle $\mathrm{C}_{9}$ having twin chords admitting difference cordial labeling.
(c) Figure 3(c) shows switching of vertex of degree 4 of cycle C9having twin chords admitting difference cordial labeling.

Theorem 4: Vertex switching of a pendant vertex of path $\mathrm{P}_{\mathrm{n}}$ is difference cordial labeling.
Proof: Suppose $z_{1}, z_{2}, \ldots, z_{n}$ be the vertices of path $P_{n}$. The graph $G$ get by Switching of a pendant vertexx ${ }_{1}$ in the path $P_{n}$. Then $|E(G)|=2 n-4 \&|V(G)|=n$.
We define labeling function $h: V(G)\{1,2, \ldots, n\}$ as follows.
$h\left(z_{i}\right)=i, i \in[1, n]$.
Then we have $\mathrm{e}_{\mathrm{h}}(1)=\mathrm{n}-2$ and $\mathrm{e}_{\mathrm{h}}(0)=\mathrm{n}-2$.
Therefore $\left|e_{h}(1)-e_{h}(0)\right| \leq 1$.
Hence switching of a pendant vertex in path $\mathrm{P}_{\mathrm{n}}$ isdifference cordial labeling.

Example 4:Switching of pendant vertex of pathP ${ }_{7}$ admitting difference cordial labeling is shown in Figure 4.

Figure 4
Theorem 5: Ring sum of star graph and cycle graph is difference cordial for all n .
Proof:Suppose $V(G)=X \cup Y$, where $X=\left\{z_{1}, z_{2}, \ldots, z_{n}\right\}$ be the vertex set of $C_{n}$ and $Y=\left\{y=z_{1}, y_{1}, y_{2}, \ldots, y_{n}\right\}$ be the vertex set of $K_{1, n}$. Here $y_{1}, y_{2}, \ldots, y_{n}$ are pendent vertices.
Also|E (G) $|=|\mathrm{V}(\mathrm{G})|=2 \mathrm{n}$.
We define labeling function $\mathrm{h}: \mathrm{V}(\mathrm{G})\{1,2, \ldots, 2 \mathrm{n}\}$ as follows.
$\mathrm{h}\left(\mathrm{z}_{1}\right)=2$,
$h\left(\mathrm{z}_{2}\right)=4$,
$h\left(z_{i}\right)=i+2, i \in[3, n]$.
$h\left(y_{1}\right)=1$,
$h\left(y_{2}\right)=3$,
$\mathrm{h}\left(\mathrm{y}_{\mathrm{i}}\right)=\mathrm{n}+\mathrm{i}, \mathrm{i} \in[3, \mathrm{n}]$.
Then in each case we have $e_{h}(1)=e_{h}(0)=n$.
Therefore $\left|e_{h}(1)-e_{h}(0)\right| \leq 1$.
Hence Ring sum of star graph and cycle graph is difference cordial.

Example 5:Ring sum of star graph $\mathrm{K}_{1,7}$ and cycleC ${ }_{7}$ admitting difference cordial labeling is shown in Figure 5.

Figure 5

Theorem6.Ring sum of star graph and cycle with one chord is difference cordial, where chord forms a triangle with two edges of thecycle.
Proof. Suppose G be the cycle having one chord and suppose $\mathrm{e}=\mathrm{z}_{2} \mathrm{z}_{\mathrm{n}}$ be the chord in G.Suppose V $=X \cup Y$, where $X=\left\{z_{1}, z_{2}, \ldots, z_{n}\right\}$ be the vertexset of $G$ and $Y=\left\{y=z_{1}, y_{1}, y_{2}, \ldots, y_{n}\right\}$ be the vertex set of star graph $K_{1, n}$. Here $_{1}, y_{2}, \ldots, y_{n}$ are pendent vertices.Also $|E(G)|=2 n+1 \&$ $|\mathrm{V}(\mathrm{G})|=2 \mathrm{n}$.
We define labeling function $\mathrm{h}: \mathrm{V}(\mathrm{G})\{1,2, \ldots, 2 \mathrm{n}\}$ as follows.
The labeling pattern is same as Theorem-5.
Then we have $\mathrm{e}_{\mathrm{h}}(1)=\mathrm{n} \operatorname{ande}_{\mathrm{h}}(0)=\mathrm{n}+1$.
Therefore $\left|e_{h}(1)-e_{h}(0)\right| \leq 1$.
Hence, Ring sum of star graph and cycle with one chord is difference cordial.
Example 6:Ring sum of $\mathrm{K}_{1,8}$ and cycle $\mathrm{C}_{8}$ with one chord having difference cordial labeling is shown in Figure 6.

Figure 6
Theorem 7:Ring sum of star graph and gear graph is difference cordialfor all n .
Proof: $\operatorname{SupposeV}(G)=X \cup Y$, where $X=\left\{x_{0}, x_{1}, x_{2}, \ldots, x_{2 n}\right\}$ with apex $x_{0}$ and $x_{1}, x_{2}, \ldots \ldots, x_{2 n}$ are other vertices of $G_{n}$,where $\operatorname{deg}\left(x_{i}\right)=2$ when i is even and $\operatorname{deg}\left(\mathrm{x}_{\mathrm{i}}\right)=3$ when i is odd and $\mathrm{Y}=\left\{\mathrm{x}_{1}=\mathrm{y}, \mathrm{y}_{1}\right.$, $\left.y_{2}, \ldots, y_{n}\right\}$ be the vertex set of $K_{1, n}$. Here $y_{1}, y_{2}, \ldots, y_{n}$ are pendent vertices and $y$ is the apex vertex of $\mathrm{K}_{1, \mathrm{n}} . \operatorname{Also}|\mathrm{E}(\mathrm{G})|=4 \mathrm{n} \&|\mathrm{~V}(\mathrm{G})|=3 \mathrm{n}+1$.
We define labeling function $\mathrm{h}: \mathrm{V}(\mathrm{G})\{1,2, \ldots, 1+3 \mathrm{n}\}$ as follows.
$\mathrm{h}\left(\mathrm{u}_{0}\right)=2 \mathrm{n}+1$,
$\mathrm{h}\left(\mathrm{u}_{2 \mathrm{n}}\right)=1$,
$h\left(\mathrm{u}_{1}\right)=2$,
$h\left(u_{i}\right)=i+1, i \in[2, n]$.
$h\left(v_{i}\right)=2 n+i+1, i \in[1, n]$.
Then we have $\mathrm{e}_{\mathrm{h}}(1)=\mathrm{e}_{\mathrm{h}}(0)=2 \mathrm{n}$.
Therefore $\left|e_{h}(1)-e_{h}(0)\right| \leq 1$.
Hence,Ring sum of star graph and gear graph is difference cordial.
Example 7:Ring sum of $\mathrm{K}_{1,7}$ and $\mathrm{G}_{7}$ is difference cordial is shown in Figure 7.

Figure 7

Theorem 8: Ring sum of star graph and path graph is difference cordial for all n.
Proof:Suppose $V\left(P_{n} \oplus K_{1, n}\right)=X \cup Y$, where $X=\left\{x_{1}, x_{2}, \ldots, x_{n}\right\}$ is the vertex set of $P_{n}$ and $Y=\left\{y=x_{1}, y_{1}, y_{2}, \ldots, y_{n}\right\}$ is the vertex set of $K_{1, n}$. Here $y_{1}, y_{2}, \ldots, y_{n}$ are the pendant vertices and yis the apex vertex. $\operatorname{Also}\left|\mathrm{E}\left(\mathrm{P}_{\mathrm{n}} \oplus \mathrm{K}_{1, \mathrm{n}}\right)\right|=2 \mathrm{n}-1$ and $\left|\mathrm{V}\left(\mathrm{P}_{\mathrm{n}} \oplus \mathrm{K}_{1, \mathrm{n}}\right)\right|=2 \mathrm{n}$.
We define labeling function $\mathrm{h}: \mathrm{V}(\mathrm{G})\{1,2, \ldots, 2 \mathrm{n}\}$ as follows.
$h\left(\mathrm{x}_{\mathrm{i}}\right)=\mathrm{i}, \mathrm{i} \in[1, \mathrm{n}]$.
$h\left(y_{i}\right)=n+i, i \in[1, n]$.
Then we have $e_{h}(1)=n-1$ and $e_{h}(0)=n$.
Therefore $\left|e_{h}(1)-e_{h}(0)\right| \leq 1$.
Hence,Ring sum of star graph and path graph is difference cordial.
Example 8:Ring sum ofK $\mathrm{K}_{1,7}$ andP $_{7}$ is difference cordial is shown in Figure 8.
